VSPERF User Guide

Release draft (970a6fe)

OPNFV

July 01, 2016

CHAPTER

ONE

VSWITCHPERF TEST SUITES USERGUIDE

1.1 General

VSPERF requires a traffic generators to run tests, automated traffic gen support in VSPERF includes:

- IXIA traffic generator (IxNetwork hardware) and a machine that runs the IXIA client software.
- Spirent traffic generator (TestCenter hardware chassis or TestCenter virtual in a VM) and a VM to run the Spirent Virtual Deployment Service image, formerly known as "Spirent LabServer".

If you want to use another traffic generator, please select the Dummy generator option as shown in Traffic generator instructions

1.2 VSPERF Installation

To see the supported Operating Systems, vSwitches and system requirements, please follow the installation instructions to install.

1.3 Traffic Generator Setup

Follow the Traffic generator instructions to install and configure a suitable traffic generator.

1.4 Cloning and building src dependencies

In order to run VSPERF, you will need to download DPDK and OVS. You can do this manually and build them in a preferred location, OR you could use vswitchperf/src. The vswitchperf/src directory contains makefiles that will allow you to clone and build the libraries that VSPERF depends on, such as DPDK and OVS. To clone and build simply:

```
$ cd src
$ make
```

VSPERF can be used with stock OVS (without DPDK support). When build is finished, the libraries are stored in src_vanilla directory.

The 'make' builds all options in src:

- Vanilla OVS
- OVS with vhost_user as the guest access method (with DPDK support)

- OVS with vhost_cuse s the guest access method (with DPDK support)

The vhost_user build will reside in src/ovs/ The vhost_cuse build will reside in vswitchperf/src_cuse The Vanilla OVS build will reside in vswitchperf/src_vanilla

To delete a src subdirectory and its contents to allow you to re-clone simply use:

```
$ make clobber
```

1.5 Configure the `./conf/10_custom.conf` file

The `10_custom.conf` file is the configuration file that overrides default configurations in all the other configuration files in `./conf` The supplied `10_custom.conf` file **MUST** be modified, as it contains configuration items for which there are no reasonable default values.

The configuration items that can be added is not limited to the initial contents. Any configuration item mentioned in any .conf file in `./conf` directory can be added and that item will be overridden by the custom configuration value.

1.6 Using a custom settings file

If your `10_custom.conf` doesn't reside in the `./conf` directory of if you want to use an alternative configuration file, the file can be passed to `vsperf` via the `--conf-file` argument.

```
$ ./vsperf --conf-file <path_to_custom_conf> ...
```

Note that configuration passed in via the environment (`--load-env`) or via another command line argument will override both the default and your custom configuration files. This "priority hierarchy" can be described like so (1 = max priority):

1. Command line arguments
2. Environment variables
3. Configuration file(s)

1.7 vloop_vnf

vsperf uses a VM called vloop_vnf for looping traffic in the PVP and PVVP deployment scenarios. The image can be downloaded from http://artifacts.opnfv.org/.

```
$ wget http://artifacts.opnfv.org/vswitchperf/vloop-vnf-ubuntu-14.04_20151216.qcow2
```

vloop_vnf forwards traffic through a VM using one of: * DPDK testpmd * Linux Bridge * l2fwd kernel Module.

Alternatively you can use your own QEMU image.

1.8 l2fwd Kernel Module

A Kernel Module that provides OSI Layer 2 Ipv4 termination or forwarding with support for Destination Network Address Translation (DNAT) for both the MAC and IP addresses. l2fwd can be found in <vswitchperf_dir>/src/l2fwd

1.9 Executing tests

Before running any tests make sure you have root permissions by adding the following line to /etc/sudoers:

```
username ALL=(ALL)       NOPASSWD: ALL
```

username in the example above should be replaced with a real username.

To list the available tests:

```
$ ./vsperf --list
```

To run a single test:

```
$ ./vsperf $TESTNAME
```

Where $TESTNAME is the name of the vsperf test you would like to run.

To run a group of tests, for example all tests with a name containing 'RFC2544':

```
$ ./vsperf --conf-file=<path_to_custom_conf>/10_custom.conf --tests="RFC2544"
```

To run all tests:

```
$ ./vsperf --conf-file=<path_to_custom_conf>/10_custom.conf
```

Some tests allow for configurable parameters, including test duration (in seconds) as well as packet sizes (in bytes).

```
$ ./vsperf --conf-file user_settings.py
    --tests RFC2544Tput
    --test-params "duration=10;pkt_sizes=128"
```

For all available options, check out the help dialog:

```
$ ./vsperf --help
```

1.10 Executing Vanilla OVS tests

1. If needed, recompile src for all OVS variants

```
$ cd src
$ make distclean
$ make
```

2. Update your "10_custom.conf" file to use the appropriate variables for Vanilla OVS:

```
VSWITCH = 'OvsVanilla'
```

Where $PORT1 and $PORT2 are the Linux interfaces you'd like to bind to the vswitch.

3. Run test:

```
$ ./vsperf --conf-file=<path_to_custom_conf>
```

Please note if you don't want to configure Vanilla OVS through the configuration file, you can pass it as a CLI argument; BUT you must set the ports.

```
$ ./vsperf --vswitch OvsVanilla
```

1.11 Executing PVP and PVVP tests

To run tests using vhost-user as guest access method:

1. Set VHOST_METHOD and VNF of your settings file to:

```
VHOST_METHOD='user'
VNF = 'QemuDpdkVhost'
```

2. If needed, recompile src for all OVS variants

```
$ cd src
$ make distclean
$ make
```

3. Run test:

```
$ ./vsperf --conf-file=<path_to_custom_conf>/10_custom.conf
```

To run tests using vhost-cuse as guest access method:

1. Set VHOST_METHOD and VNF of your settings file to:

```
VHOST_METHOD='cuse'
VNF = 'QemuDpdkVhostCuse'
```

2. If needed, recompile src for all OVS variants

```
$ cd src
$ make distclean
$ make
```

3. Run test:

```
$ ./vsperf --conf-file=<path_to_custom_conf>/10_custom.conf
```

1.12 Executing PVP tests using Vanilla OVS

To run tests using Vanilla OVS:

1. Set the following variables:

```
VSWITCH = 'OvsVanilla'
VNF = 'QemuVirtioNet'

VANILLA_TGEN_PORT1_IP = n.n.n.n
VANILLA_TGEN_PORT1_MAC = nn:nn:nn:nn:nn:nn

VANILLA_TGEN_PORT2_IP = n.n.n.n
VANILLA_TGEN_PORT2_MAC = nn:nn:nn:nn:nn:nn

VANILLA_BRIDGE_IP = n.n.n.n

or use --test-param

$ ./vsperf --conf-file=<path_to_custom_conf>/10_custom.conf
           --test-params "vanilla_tgen_tx_ip=n.n.n.n;
                          vanilla_tgen_tx_mac=nn:nn:nn:nn:nn:nn"
```

2. If needed, recompile src for all OVS variants

```
$ cd src
$ make distclean
$ make
```

3. Run test:

```
$ ./vsperf --conf-file<path_to_custom_conf>/10_custom.conf
```

1.13 Using vfio_pci with DPDK

To use vfio with DPDK instead of igb_uio edit 'conf/02_vswitch.conf' with the following parameters:

```
DPDK_MODULES = [
 ('vfio-pci'),
]
SYS_MODULES = ['cuse']
```

NOTE: Please ensure that Intel VT-d is enabled in BIOS.

NOTE: Please ensure your boot/grub parameters include the following:

```
iommu=pt intel_iommu=on
```

To check that IOMMU is enabled on your platform:

```
$ dmesg | grep IOMMU
[    0.000000] Intel-IOMMU: enabled
[    0.139882] dmar: IOMMU 0: reg_base_addr fbffe000 ver 1:0 cap d2078c106f0466 ecap f020de
[    0.139888] dmar: IOMMU 1: reg_base_addr ebffc000 ver 1:0 cap d2078c106f0466 ecap f020de
[    0.139893] IOAPIC id 2 under DRHD base  0xfbffe000 IOMMU 0
[    0.139894] IOAPIC id 0 under DRHD base  0xebffc000 IOMMU 1
[    0.139895] IOAPIC id 1 under DRHD base  0xebffc000 IOMMU 1
[    3.335744] IOMMU: dmar0 using Queued invalidation
[    3.335746] IOMMU: dmar1 using Queued invalidation
....
```

1.14 Using SRIOV support

To use virtual functions of NIC with SRIOV support, use extended form of NIC PCI slot definition:

```
WHITELIST_NICS = ['0000:05:00.0|vf0', '0000:05:00.1|vf3']
```

Where 'vf' is an indication of virtual function usage and following number defines a VF to be used. In case that VF usage is detected, then vswitchperf will enable SRIOV support for given card and it will detect PCI slot numbers of selected VFs.

So in example above, one VF will be configured for NIC '0000:05:00.0' and four VFs will be configured for NIC '0000:05:00.1'. Vswitchperf will detect PCI addresses of selected VFs and it will use them during test execution.

At the end of vswitchperf execution, SRIOV support will be disabled.

SRIOV support is generic and it can be used in different testing scenarios. For example:

- vSwitch tests with DPDK or without DPDK support to verify impact of VF usage on vSwitch performance

- tests without vSwitch, where traffic is forwared directly between VF interfaces by packet forwarder (e.g. testpmd application)
- tests without vSwitch, where VM accesses VF interfaces directly by *PCI-passthrough* to measure raw VM throughput performance.

1.15 Using QEMU with PCI passthrough support

Raw virtual machine throughput performance can be measured by execution of PVP test with direct access to NICs by PCI passthrough. To execute VM with direct access to PCI devices, enable *vfio-pci*. In order to use virtual functions, *SRIOV-support* must be enabled.

Execution of test with PCI passthrough with vswitch disabled:

```
$ ./vsperf --conf-file=<path_to_custom_conf>/10_custom.conf
           --vswtich none --vnf QemuPciPassthrough pvp_tput
```

Any of supported *guest-loopback-application* can be used inside VM with PCI passthrough support.

Note: Qemu with PCI passthrough support can be used only with PVP test deployment.

1.16 Selection of loopback application for PVP and PVVP tests

To select loopback application, which will perform traffic forwarding inside VM, following configuration parameter should be configured:

```
GUEST_LOOPBACK = ['testpmd', 'testpmd']
```

or use –test-param

```
$ ./vsperf --conf-file=<path_to_custom_conf>/10_custom.conf
      --test-params "guest_loopback=testpmd"
```

Supported loopback applications are:

```
'testpmd'       - testpmd from dpdk will be built and used
'l2fwd'         - l2fwd module provided by Huawei will be built and used
'linux_bridge'  - linux bridge will be configured
'buildin'       - nothing will be configured by vsperf; VM image must
                  ensure traffic forwarding between its interfaces
```

Guest loopback application must be configured, otherwise traffic will not be forwarded by VM and testcases with PVP and PVVP deployments will fail. Guest loopback application is set to ‘testpmd’ by default.

1.17 Executing Packet Forwarding tests

To select application, which will perform packet forwarding, following configuration parameter should be configured:

```
    VSWITCH = 'none'
    PKTFWD = 'TestPMD'

    or use --vswitch and --fwdapp

    $ ./vsperf --conf-file user_settings.py
```

```
            --vswitch none
            --fwdapp TestPMD
```

Supported Packet Forwarding applications are:

```
    'testpmd'       - testpmd from dpdk
```

1. Update your "10_custom.conf" file to use the appropriate variables for selected Packet Forwarder:

```
    # testpmd configuration
    TESTPMD_ARGS = []
    # packet forwarding mode: io|mac|mac_retry|macswap|flowgen|rxonly|txonly|csum|icmpecho
    TESTPMD_FWD_MODE = 'csum'
    # checksum calculation layer: ip|udp|tcp|sctp|outer-ip
    TESTPMD_CSUM_LAYER = 'ip'
    # checksum calculation place: hw (hardware) | sw (software)
    TESTPMD_CSUM_CALC = 'sw'
    # recognize tunnel headers: on|off
    TESTPMD_CSUM_PARSE_TUNNEL = 'off'
```

2. Run test:

```
    $ ./vsperf --conf-file <path_to_settings_py>
```

1.18 VSPERF modes of operation

VSPERF can be run in different modes. By default it will configure vSwitch, traffic generator and VNF. However it can be used just for configuration and execution of traffic generator. Another option is execution of all components except traffic generator itself.

Mode of operation is driven by configuration parameter -m or –mode

```
-m MODE, --mode MODE  vsperf mode of operation;
    Values:
        "normal" - execute vSwitch, VNF and traffic generator
        "trafficgen" - execute only traffic generator
        "trafficgen-off" - execute vSwitch and VNF
        "trafficgen-pause" - execute vSwitch and VNF but wait before traffic transmission
```

In case, that VSPERF is executed in "trafficgen" mode, then configuration of traffic generator should be configured through –test-params option. Supported CLI options useful for traffic generator configuration are:

```
'traffic_type'  - One of the supported traffic types. E.g. rfc2544,
                  back2back or continuous
                  Default value is "rfc2544".
'bidirectional' - Specifies if generated traffic will be full-duplex (true)
                  or half-duplex (false)
                  Default value is "false".
'iload'         - Defines desired percentage of frame rate used during
                  continuous stream tests.
                  Default value is 100.
'multistream'   - Defines number of flows simulated by traffic generator.
                  Value 0 disables MultiStream feature
                  Default value is 0.
'stream_type'   - Stream Type is an extension of the "MultiStream" feature.
                  If MultiStream is disabled, then Stream Type will be
                  ignored. Stream Type defines ISO OSI network layer used
```

```
                    for simulation of multiple streams.
                    Default value is "L4".
```

Example of execution of VSPERF in "trafficgen" mode:

```
$ ./vsperf -m trafficgen --trafficgen IxNet --conf-file vsperf.conf
    --test-params "traffic_type=continuous;bidirectional=True;iload=60"
```

1.19 Code change verification by pylint

Every developer participating in VSPERF project should run pylint before his python code is submitted for review. Project specific configuration for pylint is available at 'pylint.rc'.

Example of manual pylint invocation:

```
$ pylint --rcfile ./pylintrc ./vsperf
```

1.20 GOTCHAs:

1.20.1 OVS with DPDK and QEMU

If you encounter the following error: "before (last 100 chars): '-path=/dev/hugepages,share=on: unable to map backing store for hugepages: Cannot allocate memoryrnrn" with the PVP or PVVP deployment scenario, check the amount of hugepages on your system:

```
$ cat /proc/meminfo | grep HugePages
```

By default the vswitchd is launched with 1Gb of memory, to change this, modify –socket-mem parameter in conf/02_vswitch.conf to allocate an appropriate amount of memory:

```
VSWITCHD_DPDK_ARGS = ['-c', '0x4', '-n', '4', '--socket-mem 1024,0']
VSWITCHD_DPDK_CONFIG = {
    'dpdk-init' : 'true',
    'dpdk-lcore-mask' : '0x4',
    'dpdk-socket-mem' : '1024,0',
}
```

Note: Option VSWITCHD_DPDK_ARGS is used for vswitchd, which supports –dpdk parameter. In recent vswitchd versions, option VSWITCHD_DPDK_CONFIG will be used to configure vswitchd via ovs-vsctl calls.

1.21 More information

For more information and details refer to the vSwitchPerf user guide at: http://artifacts.opnfv.org/vswitchperf/brahmaputra/userguide/index.html

CHAPTER

TWO

INTEGRATION TESTS

VSPERF includes a set of integration tests defined in conf/integration. These tests can be run by specifying –integration as a parameter to vsperf. Current tests in conf/integration include switch functionality and Overlay tests.

Tests in the conf/integration can be used to test scaling of different switch configurations by adding steps into the test case.

For the overlay tests VSPERF supports VXLAN, GRE and GENEVE tunneling protocols. Testing of these protocols is limited to unidirectional traffic and P2P (Physical to Physical scenarios).

NOTE: The configuration for overlay tests provided in this guide is for unidirectional traffic only.

2.1 Executing Integration Tests

To execute integration tests VSPERF is run with the integration parameter. To view the current test list simply execute the following command:

```
./vsperf --integration --list
```

The standard tests included are defined inside the `conf/integration/01_testcases.conf` file.

2.2 Test Steps

Execution of integration tests are done on a step by step work flow starting with step 0 as defined inside the test case. Each step of the test increments the step number by one which is indicated in the log.

```
(testcases.integration) - Step 1 - 'vswitch add_switch ['int_br1']' ... OK
```

Each step in the test case is validated. If a step does not pass validation the test will fail and terminate. The test will continue until a failure is detected or all steps pass. A csv report file is generated after a test completes with an OK or FAIL result.

2.3 Test Macros

Test profiles can include macros as part of the test step. Each step in the profile may return a value such as a port name. Recall macros use #STEP to indicate the recalled value inside the return structure. If the method the test step calls returns a value it can be later recalled, for example:

```
{
    "Name": "vswitch_add_del_vport",
    "Deployment": "clean",
    "Description": "vSwitch - add and delete virtual port",
    "TestSteps": [
            ['vswitch', 'add_switch', 'int_br0'],               # STEP 0
            ['vswitch', 'add_vport', 'int_br0'],                # STEP 1
            ['vswitch', 'del_port', 'int_br0', '#STEP[1][0]'],  # STEP 2
            ['vswitch', 'del_switch', 'int_br0'],               # STEP 3
        ]
}
```

This test profile uses the the vswitch add_vport method which returns a string value of the port added. This is later called by the del_port method using the name from step 1.

Also commonly used steps can be created as a separate profile.

```
STEP_VSWITCH_PVP_INIT = [
    ['vswitch', 'add_switch', 'int_br0'],           # STEP 0
    ['vswitch', 'add_phy_port', 'int_br0'],         # STEP 1
    ['vswitch', 'add_phy_port', 'int_br0'],         # STEP 2
    ['vswitch', 'add_vport', 'int_br0'],            # STEP 3
    ['vswitch', 'add_vport', 'int_br0'],            # STEP 4
]
```

This profile can then be used inside other testcases

```
{
    "Name": "vswitch_pvp",
    "Deployment": "clean",
    "Description": "vSwitch - configure switch and one vnf",
    "TestSteps": STEP_VSWITCH_PVP_INIT +
                 [
                    ['vnf', 'start'],
                    ['vnf', 'stop'],
                 ] +
                 STEP_VSWITCH_PVP_FINIT
}
```

2.4 Executing Tunnel encapsulation tests

The VXLAN OVS DPDK encapsulation tests requires IPs, MAC addresses, bridge names and WHITELIST_NICS for DPDK.

Default values are already provided. To customize for your environment, override the following variables in you user_settings.py file:

```
    # Variables defined in conf/integration/02_vswitch.conf
    # Tunnel endpoint for Overlay P2P deployment scenario
    # used for br0
    VTEP_IP1 = '192.168.0.1/24'

    # Used as remote_ip in adding OVS tunnel port and
    # to set ARP entry in OVS (e.g. tnl/arp/set br-ext 192.168.240.10 02:00:00:00:00:02
    VTEP_IP2 = '192.168.240.10'

    # Network to use when adding a route for inner frame data
```

```
VTEP_IP2_SUBNET = '192.168.240.0/24'

# Bridge names
TUNNEL_INTEGRATION_BRIDGE = 'br0'
TUNNEL_EXTERNAL_BRIDGE = 'br-ext'

# IP of br-ext
TUNNEL_EXTERNAL_BRIDGE_IP = '192.168.240.1/24'

# vxlan|gre|geneve
TUNNEL_TYPE = 'vxlan'

# Variables defined conf/integration/03_traffic.conf
# For OP2P deployment scenario
TRAFFICGEN_PORT1_MAC = '02:00:00:00:00:01'
TRAFFICGEN_PORT2_MAC = '02:00:00:00:00:02'
TRAFFICGEN_PORT1_IP = '1.1.1.1'
TRAFFICGEN_PORT2_IP = '192.168.240.10'
```

To run VXLAN encapsulation tests:

```
./vsperf --conf-file user_settings.py --integration
         --test-params 'tunnel_type=vxlan' overlay_p2p_tput
```

To run GRE encapsulation tests:

```
./vsperf --conf-file user_settings.py --integration
         --test-params 'tunnel_type=gre' overlay_p2p_tput
```

To run GENEVE encapsulation tests:

```
./vsperf --conf-file user_settings.py --integration
         --test-params 'tunnel_type=geneve' overlay_p2p_tput
```

To run OVS NATIVE tunnel tests (VXLAN/GRE/GENEVE):

1. Install the OVS kernel modules

```
cd src/ovs/ovs
sudo -E make modules_install
```

2. Set the following variables:

```
VSWITCH = 'OvsVanilla'
# Specify vport_* kernel module to test.
VSWITCH_VANILLA_KERNEL_MODULES = ['vport_vxlan',
                                  'vport_gre',
                                  'vport_geneve',
                                  os.path.join(OVS_DIR_VANILLA,
                                  'datapath/linux/openvswitch.ko')]
```

3. Run tests:

```
./vsperf --conf-file user_settings.py --integration
         --test-params 'tunnel_type=vxlan' overlay_p2p_tput
```

2.5 Executing VXLAN decapsulation tests

To run VXLAN decapsulation tests:

1. Set the variables used in "Executing Tunnel encapsulation tests"
2. Set dstmac of DUT_NIC2_MAC to the MAC adddress of the 2nd NIC of your DUT

```
DUT_NIC2_MAC = '<DUT NIC2 MAC>'
```

3. Run test:

```
./vsperf --conf-file user_settings.py --integration overlay_p2p_decap_cont
```

If you want to use different values for your VXLAN frame, you may set:

```
VXLAN_FRAME_L3 = {'proto': 'udp',
                  'packetsize': 64,
                  'srcip': TRAFFICGEN_PORT1_IP,
                  'dstip': '192.168.240.1',
                 }
VXLAN_FRAME_L4 = {'srcport': 4789,
                  'dstport': 4789,
                  'vni': VXLAN_VNI,
                  'inner_srcmac': '01:02:03:04:05:06',
                  'inner_dstmac': '06:05:04:03:02:01',
                  'inner_srcip': '192.168.0.10',
                  'inner_dstip': '192.168.240.9',
                  'inner_proto': 'udp',
                  'inner_srcport': 3000,
                  'inner_dstport': 3001,
                 }
```

2.6 Executing GRE decapsulation tests

To run GRE decapsulation tests:

1. Set the variables used in "Executing Tunnel encapsulation tests"
2. Set dstmac of DUT_NIC2_MAC to the MAC adddress of the 2nd NIC of your DUT

```
DUT_NIC2_MAC = '<DUT NIC2 MAC>'
```

3. Run test:

```
./vsperf --conf-file user_settings.py --test-params 'tunnel_type=gre'
         --integration overlay_p2p_decap_cont
```

If you want to use different values for your GRE frame, you may set:

```
GRE_FRAME_L3 = {'proto': 'gre',
                'packetsize': 64,
                'srcip': TRAFFICGEN_PORT1_IP,
                'dstip': '192.168.240.1',
               }

GRE_FRAME_L4 = {'srcport': 0,
                'dstport': 0
```

```
                    'inner_srcmac': '01:02:03:04:05:06',
                    'inner_dstmac': '06:05:04:03:02:01',
                    'inner_srcip': '192.168.0.10',
                    'inner_dstip': '192.168.240.9',
                    'inner_proto': 'udp',
                    'inner_srcport': 3000,
                    'inner_dstport': 3001,
                   }
```

2.7 Executing GENEVE decapsulation tests

IxNet 7.3X does not have native support of GENEVE protocol. The template, GeneveIxNetTemplate.xml_ClearText.xml, should be imported into IxNET for this testcase to work.

To import the template do:

1. Run the IxNetwork TCL Server
2. Click on the Traffic menu
3. Click on the Traffic actions and click Edit Packet Templates
4. On the Template editor window, click Import. Select the template tools/pkt_gen/ixnet/GeneveIxNetTemplate.xml_ClearText.xml and click import.
5. Restart the TCL Server.

To run GENEVE decapsulation tests:

1. Set the variables used in "Executing Tunnel encapsulation tests"
2. Set dstmac of DUT_NIC2_MAC to the MAC adddress of the 2nd NIC of your DUT

```
    DUT_NIC2_MAC = '<DUT NIC2 MAC>'
```

3. Run test:

```
    ./vsperf --conf-file user_settings.py --test-params 'tunnel_type=geneve'
             --integration overlay_p2p_decap_cont
```

If you want to use different values for your GENEVE frame, you may set:

```
    GENEVE_FRAME_L3 = {'proto': 'udp',
                       'packetsize': 64,
                       'srcip': TRAFFICGEN_PORT1_IP,
                       'dstip': '192.168.240.1',
                      }

    GENEVE_FRAME_L4 = {'srcport': 6081,
                       'dstport': 6081,
                       'geneve_vni': 0,
                       'inner_srcmac': '01:02:03:04:05:06',
                       'inner_dstmac': '06:05:04:03:02:01',
                       'inner_srcip': '192.168.0.10',
                       'inner_dstip': '192.168.240.9',
                       'inner_proto': 'udp',
                       'inner_srcport': 3000,
                       'inner_dstport': 3001,
                      }
```

2.8 Executing Native/Vanilla OVS VXLAN decapsulation tests

To run VXLAN decapsulation tests:

1. Set the following variables in your user_settings.py file:

```
VSWITCH_VANILLA_KERNEL_MODULES = ['vport_vxlan',
                                  os.path.join(OVS_DIR_VANILLA,
                                  'datapath/linux/openvswitch.ko')]

DUT_NIC1_MAC = '<DUT NIC1 MAC ADDRESS>'

TRAFFICGEN_PORT1_IP = '172.16.1.2'
TRAFFICGEN_PORT2_IP = '192.168.1.11'

VTEP_IP1 = '172.16.1.2/24'
VTEP_IP2 = '192.168.1.1'
VTEP_IP2_SUBNET = '192.168.1.0/24'
TUNNEL_EXTERNAL_BRIDGE_IP = '172.16.1.1/24'
TUNNEL_INT_BRIDGE_IP = '192.168.1.1'

VXLAN_FRAME_L2 = {'srcmac':
                  '01:02:03:04:05:06',
                  'dstmac': DUT_NIC1_MAC
                 }

VXLAN_FRAME_L3 = {'proto': 'udp',
                  'packetsize': 64,
                  'srcip': TRAFFICGEN_PORT1_IP,
                  'dstip': '172.16.1.1',
                 }

VXLAN_FRAME_L4 = {
                  'srcport': 4789,
                  'dstport': 4789,
                  'protocolpad': 'true',
                  'vni': 99,
                  'inner_srcmac': '01:02:03:04:05:06',
                  'inner_dstmac': '06:05:04:03:02:01',
                  'inner_srcip': '192.168.1.2',
                  'inner_dstip': TRAFFICGEN_PORT2_IP,
                  'inner_proto': 'udp',
                  'inner_srcport': 3000,
                  'inner_dstport': 3001,
                 }
```

2. Run test:

```
./vsperf --conf-file user_settings.py --integration
         --test-params 'tunnel_type=vxlan' overlay_p2p_decap_cont
```

2.9 Executing Native/Vanilla OVS GRE decapsulation tests

To run GRE decapsulation tests:

1. Set the following variables in your user_settings.py file:

```
    VSWITCH_VANILLA_KERNEL_MODULES = ['vport_gre',
                                      os.path.join(OVS_DIR_VANILLA,
                                      'datapath/linux/openvswitch.ko')]

    DUT_NIC1_MAC = '<DUT NIC1 MAC ADDRESS>'

    TRAFFICGEN_PORT1_IP = '172.16.1.2'
    TRAFFICGEN_PORT2_IP = '192.168.1.11'

    VTEP_IP1 = '172.16.1.2/24'
    VTEP_IP2 = '192.168.1.1'
    VTEP_IP2_SUBNET = '192.168.1.0/24'
    TUNNEL_EXTERNAL_BRIDGE_IP = '172.16.1.1/24'
    TUNNEL_INT_BRIDGE_IP = '192.168.1.1'

    GRE_FRAME_L2 = {'srcmac':
                    '01:02:03:04:05:06',
                    'dstmac': DUT_NIC1_MAC
                   }

    GRE_FRAME_L3 = {'proto': 'udp',
                    'packetsize': 64,
                    'srcip': TRAFFICGEN_PORT1_IP,
                    'dstip': '172.16.1.1',
                   }

    GRE_FRAME_L4 = {
                    'srcport': 4789,
                    'dstport': 4789,
                    'protocolpad': 'true',
                    'inner_srcmac': '01:02:03:04:05:06',
                    'inner_dstmac': '06:05:04:03:02:01',
                    'inner_srcip': '192.168.1.2',
                    'inner_dstip': TRAFFICGEN_PORT2_IP,
                    'inner_proto': 'udp',
                    'inner_srcport': 3000,
                    'inner_dstport': 3001,
                   }
```

2. Run test:

```
    ./vsperf --conf-file user_settings.py --integration
             --test-params 'tunnel_type=gre' overlay_p2p_decap_cont
```

2.10 Executing Native/Vanilla OVS GENEVE decapsulation tests

To run GENEVE decapsulation tests:

1. Set the following variables in your user_settings.py file:

```
    VSWITCH_VANILLA_KERNEL_MODULES = ['vport_geneve',
                                      os.path.join(OVS_DIR_VANILLA,
                                      'datapath/linux/openvswitch.ko')]

    DUT_NIC1_MAC = '<DUT NIC1 MAC ADDRESS>'

    TRAFFICGEN_PORT1_IP = '172.16.1.2'
```

```
    TRAFFICGEN_PORT2_IP = '192.168.1.11'

    VTEP_IP1 = '172.16.1.2/24'
    VTEP_IP2 = '192.168.1.1'
    VTEP_IP2_SUBNET = '192.168.1.0/24'
    TUNNEL_EXTERNAL_BRIDGE_IP = '172.16.1.1/24'
    TUNNEL_INT_BRIDGE_IP = '192.168.1.1'

    GENEVE_FRAME_L2 = {'srcmac':
                       '01:02:03:04:05:06',
                       'dstmac': DUT_NIC1_MAC
                      }

    GENEVE_FRAME_L3 = {'proto': 'udp',
                       'packetsize': 64,
                       'srcip': TRAFFICGEN_PORT1_IP,
                       'dstip': '172.16.1.1',
                      }

    GENEVE_FRAME_L4 = {'srcport': 6081,
                       'dstport': 6081,
                       'protocolpad': 'true',
                       'geneve_vni': 0,
                       'inner_srcmac': '01:02:03:04:05:06',
                       'inner_dstmac': '06:05:04:03:02:01',
                       'inner_srcip': '192.168.1.2',
                       'inner_dstip': TRAFFICGEN_PORT2_IP,
                       'inner_proto': 'udp',
                       'inner_srcport': 3000,
                       'inner_dstport': 3001,
                      }
```

2. Run test:

```
    ./vsperf --conf-file user_settings.py --integration
             --test-params 'tunnel_type=geneve' overlay_p2p_decap_cont
```
